

VILLA ZANE - FAENZA (RAVENNA)

A PRESTIGIOUS BUILDING ON SEVERAL FLOORS

In Faenza, in the province of Ravenna, we have built a turnkey villa with the Platform-Frame system. This technique made it possible to build a multi-storey structure with high standards of energy saving and resistance to seismic stresses. The choice of a wooden house was also enhanced in an aesthetic key, through the creation of external balconies and barriers that filter the light and shelter from the elements.

PRODUCT SPECIFICATION

Multi-storey Apartment Building Timber apartment block

Localization: Faenza (RA)

Intended use: Detached or Duplex homes Residential buildings

Architetur and structural design:

Total area: ft

BUILDING SYSTEM

Platform-Frame

Reasons for choosing the Platform-Frame system

The Platform-Frame system is ideal for building prefabricated multi-storey homes and other types of timber buildings. This system can be used to create single residential units and condominium buildings of up to four floors in elevation. That explains why this construction technique is especially suitable for **timber buildings for social housing needs:** structures for emergency accommodation needs and shared community spaces. The system also offers excellent **insulation and antiseismic properties:** it offers the highest structural coefficient of all timber construction types. It's also an **economical and easy to erect system.**

About the Platform-Frame system

In the Platform-Frame construction system each floor of a building functions as a platform to support the floors above. Although developed in Northern Europe, the Platform-Frame system is widely used in North America. **Each wall or floor is composed of evenly spaced laminated wood or KVH structural timber studs.** The building frame is covered on the exterior side by OSB structural cladding, fixed by means of ring-shank nails and metal angle brackets. The Platform-Frame system is generally built on a reinforced concrete plinth. The connection between timber building and foundations is assured by threaded steel bars or expansion anchors.
